

### **AMENDMENTS TO THE SPECIFICATION**

Please replace the paragraph beginning at page 23, line 1, which starts "The services provided" with the following paragraph:

The services provided by the servers 112 may be simple or they may be complex. A single set of services may exist on a single server computer 112, or the server computer 112 may be executing several server application programs, or a single server application program may be distributed between several server computers 112. Generally speaking, one often finds dedicated servers 112 within an organization that provide e-mail messaging services to a number of clients 122; ergo the term "mail server" is often used to describe these types of servers 112. Many businesses also utilize servers 112 to provide for centralized storage and distribution of files (i.e., "file servers"). Some servers 112 perform more specialized services such as authenticating secure IP packets (i.e., "IP security servers"). But the most significant growth of services over the past 10 years has occurred in the area of web page storage and distribution (i.e., "web servers"). Through the proliferation of technologies such as hypertext markup language (HTML), literally hundreds of thousands of businesses and individuals have been able to construct and operate servers 112 for distributing data in the form of HTML web pages to any client machine 122 that employs a web client application program. ~~Microsoft's Internet Explorer~~ MICROSOFT® INTERNET EXPLORER® web browser is one example of a web client, or web browser.
